

Multiples simple fractions

Multiplying fractions is similar to multiplying whole numbers. To do this, multiply the **numerators** together and then multiply the **denominators**. If the result is an **improper fraction**, simplify or reduce it to its **lowest terms**.

Example:

$$\frac{2}{3} \times \frac{4}{5} = \frac{2 \times 4}{3 \times 5} = \frac{8}{15}$$
